

## “STOCHASTIC PROCESSES” – HOMEWORK SHEET 3

### Exercise 3.1. (10 points)

Let  $(\Omega, \mathcal{F}, P)$  be a probability space. Given two random variables  $X$  and  $Y$  in  $L^2$ , the covariance of  $X$  and  $Y$  is given as

$$\text{Cov}(X, Y) = E[(X - E[X])(Y - E[Y])]$$

and the variance of  $X$  as

$$\text{Var}(X) = \text{Cov}(X, X) = E[(X - E[X])^2].$$

Let  $(X_n)$  be a sequence of pairwise uncorrelated random variables in  $L^2$  such that  $\sup \text{Var}(X_n) < \infty$ . Defining

$$S_n = \frac{1}{n} \sum_{k \leq n} (X_k - E[X_k]),$$

show that  $S_n \rightarrow 0$  in probability.<sup>1</sup>

### Exercise 3.2. (10 Points)

We consider a very simple financial market with two stocks  $S^1$  and  $S^2$  which values tomorrow depends on three states, that is  $\Omega := \{\omega_1, \omega_2, \omega_3\}$ . The values are given as follows

$$S^1(\omega) := \begin{cases} 90 & \text{if } \omega = \omega_1 \text{ or } \omega = \omega_2 \\ 110 & \text{if } \omega = \omega_3 \end{cases} \quad \text{and} \quad S^2(\omega) := \begin{cases} 90 & \text{if } \omega = \omega_1 \\ 100 & \text{if } \omega = \omega_2 \\ 110 & \text{if } \omega = \omega_3 \end{cases}$$

We set  $\mathcal{F} = 2^\Omega$  and consider that each state comes with the same probability, that is, we consider the uniform probability measure  $P$  on  $\mathcal{F}$  given by  $P[\{\omega_1\}] = P[\{\omega_2\}] = P[\{\omega_3\}] = 1/3$ .

Suppose that you are an insider that have the knowledge about the outcome of  $X$  tomorrow. Compute the conditional expected value of  $Y$  with respect to this information, that is  $E[Y|X]$ .<sup>2</sup>

### Exercise 3.3. (18 points)

Let  $(\Omega, \mathcal{F}, P)$  be a probability space and  $\mathcal{G} \subseteq \mathcal{F}$  be a sub- $\sigma$ -algebra. Show that

- (i)  $E[|E[X|\mathcal{G}]|] \leq E[|X|]$  for every  $X \in L^1(\mathcal{F})$ .
- (ii) the mapping  $X \mapsto E[X|\mathcal{G}]$  from  $L^1(\mathcal{F})$  to  $L^1(\mathcal{G})$  is linear and Lipschitz continuous;
- (iii)  $E[X|\mathcal{G}] \geq 0$   $P$ -almost surely whenever  $0 \leq X$   $P$ -almost surely and  $X \in L^1(\mathcal{F})$ ;
- (iv)  $E[X_n|\mathcal{G}] \nearrow E[X|\mathcal{G}]$   $P$ -almost surely for every sequence  $(X_n)$  of elements in  $L^1(\mathcal{F})$  such that  $0 \leq X_n \nearrow X \in L^1(\mathcal{F})$ ;
- (v)  $E[\liminf X_n|\mathcal{G}] \leq \liminf E[X_n|\mathcal{G}]$  for every sequence  $(X_n)$  of elements in  $L^1(\mathcal{F})$  such that  $X_n \geq Y \in L^1(\mathcal{F})$ ;

<sup>1</sup>What about Markov inequality?...

<sup>2</sup>Under this terminology, we understand conditional expectation of  $Y$  with respect to the  $\sigma$ -algebra generated by  $X$ , that is  $\sigma(X)$ .

- (vi)  $E[X_n|\mathcal{G}] \rightarrow E[X|\mathcal{G}]$   $P$ -almost surely and in  $L^1(\mathcal{F})$  for every sequence  $(X_n)$  of elements in  $L^1(\mathcal{F})$  such that  $|X_n| \leq Y \in L^1(\mathcal{F})$  for every  $n$ ;
- (vii)  $E[YX|\mathcal{G}] = YE[X|\mathcal{G}]$  whenever  $Y$  is  $\mathcal{G}$ -measurable and  $XY$  is integrable;
- (viii)  $E[XE[Y|\mathcal{G}]] = E[E[X|\mathcal{G}]Y] = E[E[X|\mathcal{G}]E[Y|\mathcal{G}]]$  whenever  $X$  and  $Y$  are in  $L^2$ ;
- (ix)  $E[E[X|\mathcal{G}_2]|\mathcal{G}_1] = E[X|\mathcal{G}_1]$  whenever the  $\sigma$ -algebras are such that  $\mathcal{G}_1 \subseteq \mathcal{G}_2 \subseteq \mathcal{F}$ .

**Exercise 3.4.** (Bonus 10 points)

Let  $(\Omega, \mathcal{F}, P)$  be a probability space where  $\Omega = [0, 1]$ ,  $\mathcal{F}$  is the Borel- $\sigma$ -algebra of  $[0, 1]$  and  $P$  is the Lebesgue measure on  $[0, 1]$ . On the vector space  $L^0$ , we consider the topology generated by the distance<sup>3</sup>

$$d(X, Y) = E \left[ \frac{|X - Y|}{1 + |X - Y|} \right].$$

Let  $C \subseteq L^0$  be a convex set with non empty interior<sup>4</sup>. Show that  $C = L^0$ .<sup>5</sup> Deduce that the only continuous linear function  $I : L^0 \rightarrow \mathbb{R}$  with this topology is the constant 0, that is,  $I(X) = 0$  for every  $X \in L^0$ .<sup>6</sup>

**Due date:** Upload before Monday 2015.10.19 14:00.

<sup>3</sup>Which according to the last homework sheet corresponds to the topology of convergence in probability.

<sup>4</sup>That is, there exists a open ball  $B_\varepsilon(Y) = \{X : d(X, Y) < \varepsilon\}$  with  $Y \in C$  and  $\varepsilon > 0$  such that  $B_\varepsilon(Y) \subseteq C$ .

<sup>5</sup>Show that without loss of generality you can assume that  $B_\varepsilon(0) \subseteq C$  for some  $\varepsilon > 0$  and approximate any  $X \in L^0$  by smart convex combinations – with more than two elements – of elements in  $B_\varepsilon(0)$ .

<sup>6</sup>If  $I$  is linear and continuous, it follows that  $I^{-1}(]-\varepsilon, \varepsilon])$  is convex and open.
